

## **Ecstasy**

**( MDMA )**

- **MDMA is an illegal drug that acts as both a stimulant and hallucinogen**
- **A drug in pill form that produces the effect of “ecstasy” as explained by users and is well known amongst ravers and clubbers as it enhances the sensations and the music while keeping the users awake**
- **Produces extreme mood lift, increase in energy, increase in social outgoingness, acuteness to senses (hearing, touch and sight), and feelings of comfort and love are more apparent**
- **Is under the category of psychoactive drugs**
- **Also known as ‘Molly’**
- **Causes long-term health risks including harm to serotonin-producing neurons and to mood and cognition; kills brain cells; destroys neural pathways, causes extreme dehydration; increases body temperature to dangerous levels**
